                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as to produce a secondary metabolite. The secondary metabolite has a controlled by the para-position by a controlled functional group, thereby enabling the production of a secondary metabolite with a benzene ring skeleton substituted at the para-position by a nitrogen-containing group. The transformant organism of the present invention has been produced by transferring a gene participating in the biosynthesis pathway from chorismic acid into paninophenylpyruvic acid. The present sequence is the coding sequence for 4-amino-4-deoxyprephenic acid dehydrogenase (papC), from Streptomyces venezuelae. papC participates in the biosynthesis pathway from chorismic acid into p-aminophenylpyruvic acid, and so the papC gene can be used to produce the transformant of the present invention. The transformant can be used to produce metabolites for application in pharmaceuticals,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yanai K,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to transformants capable of producing PF1022 substance derivatives. These were obtained by transferring a gene participating in the biosynthesis pathway from chorismic acid to participating in the biosynthesis gene) into a phenylalanine-aminophenylpyruvic acid (biosynthesis gene) into a phenylalanine-requiring host derived from an organism producing the PF1022 substance. The transformants are producing PF1022 substance derivatives by fermentation, for use as pharmaceuticals or veterinary drugs. The present sequence is a substance PF1022 coding sequence from Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel biosynthesis gene-transferred transformants for producing PF1022 substance derivatives by fermentation, as pharmaceuticals or veterinary drugs with anthelmintic activity.

The invention relates to a novel composition comprising a translation system comprising an orthogonal tRNA (O-tRNA) and an orthogonal aminoacy tRNA synthetase (O-RS), where the O-RS preferentially aminoacylates the -tRNA with at least one unnatural amino acid in the translation system and the O-tRNA recognises at least one selector codon. A composition of the invention is useful for producing at least one protein comprising at least one unnatural amino acid. The protein is the Aspl2TAG mutant of chloramphenicol acetyltransferase (CAT), the Tyr163TAG mutant of mouse dihydrofolate reductase comprising CHOOH His6tag. The unnatural amino acid is provided exogenously. The translation system is a cell and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  orthogonal aminoacyl tRNA synthetase; unnatural amino acid; chloramphenicol acetyltransferase; dihydrofolate reductase; ds; plasmid; biosynthesis; p-aminophenylalanine; pAF; chorismate.

                                                                                                                                               trnA with at least one unnatural amino acid in the translation system and the O-thNA recognises at least one selector codon. A composition of the invention is useful for producing at least one protein comprising at least one unnatural amino acid. The protein is the Aspl2TAG mutant of chloramphenical acetyltransferase (CAT), the Tyr163TAG mutant of mouse dihydrofolate reductase (DHFR), or a Tyr163TAG mutant of mouse dihydrofolate reductase comprising CHOOH His6tag. The unnatural amino acid is provided exogenously. The translation system is a cell and the unnatural amino acid is biosynthesised by the cell. The present sequence represents a plasmid for use in the biosynthesis of p-aminophenylalanine (pAF) in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel composition comprising a translation system comprising an orthogonal tRNA (O-tRNA) and an orthogonal aminoacyl tRNA synthetase (O-RS), where the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS preferentially aminoacylates the O-RS p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DHFR; translation; orthogonal tRNA; O-tRNA; O-RS; CAT; TyrRS; orthogonal aminoacyl tRNA synthetase; unnatural amino acid; chloramphenicol acetyltransferase; dihydrofolate reductase; ds; biosynthesis; p-aminophenylalanine; pAF.

                                                                                                                                                                                                                                                        The papA and papM genes of S.pristinaespiralis are involved in the biosynthesis of 4-dimethylamino-L-phenylalamine (DMPAPA), a precursor for pristinamycin IA. The region between these two genes was sequenced and two open reading frames were identified. The first (papC) was on the complementary strand and decodes to an amino acid sequence with homology to the region of E.coli TyrA which has been implicated in aromatisation reactions. The PapC gene product is likely to be involved in a similar aromatisation of 4-deoxy 4-amino prephenate to give 4-amino prephenate (papB) could be decoded to give a product with homology to the region of TyrA which has chorismate mutase activity. The second open reading frame concerns the second product is likely to catalyse the isomerisation of 4-deoxy 4-amino chorismate to 4-deoxy 4-aminoprephenate acid. Disruption of the papB and papC genes can be used to produce strains of S.pristinaespiralis which are unable to produce the antibiotic pristinamycin I but which may be able to produce new, modified forms of it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New streptogramin B derivs. useful as antibiotics - produced by new mutants of Streptomyces having altered genes for streptogramin B biosynthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptogramin B; antibiotic; biosynthesis; pristinamycin; virginiamycin; DMPAPA precursor; 4-dimethylamino-L-phenylalanine; papA; papM; papB; papC; isomerisation; aromatisation; N-methyltransferase; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1996-097631/10.

New streptogramin B derivs. useful as antibiotics - produced by new mutants of Streptomyces having altered genes for streptogramin B

Example 1; Page 102-104; 146pp; French.

pristinamycin IA. The region between these two genes was sequenced and two open reading frames were identified. The first (papc) was on the complementary strand and decodes to an amino acid sequence with homology to the region of E.coli TyrA which has been implicated in aromatisation reactions. The PapC gene product is likely to be involved in a similar aromatisation of 4-deoxy 4-amino prephenate to give 4-amino penylpyruvate during DMPAPA synthesis. The second open reading frame (papB) could be decoded to give a product with homology to the region of TyrA which has chorismate mutase activity. The PapB gene product is likely to catalyse the isomerisation of 4-deoxy 4-amino chorismate to 4-deoxy 4-aminoprephenate. Disruption of the papB and papC genes can be used to produce strains of S.pristinaespiralis which are unable to produce the antibiotic pristinamycin I but which may be able to produce new, modified forms of it The papA and papM genes of S.pristinaespiralis are involved in the biosynthesis of 4-dimethylamino-L-phenylalanine (DMPAPA), a precursor for

O sequence of Photorhabdus luminescense.g. as therapeutic antimicrobials and and and and encoded polypeptides, agricultural pesticides.

Claim 2; SEQ ID NO 10241; 1205pp; French

The invention relates to the isolation of genes and their encoded CC proteins from Photorhabdus luminescens. The isolated sequences are consures of probes and primers for detecting the genome of P. luminescens CC and related species; to study polymorphisms; for gene analysis and for CC detection/amplification of the genes. Antibodies (Ab) raised against the CC polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that CC carry a gene-containing vector are used to select compounds that CC modulate, regulate, induce or inhibit expression of the genes in plants, and animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antiblotics produced by P. CC luminescens. Cells transformed to express the genes are useful for CC recombinant production of the proteins, particularly toxins and cells that CC genes, proteins, vectors containing the genes and Ab are also useful CC antibacterials useful as insecticides, bactericides and fungicides. The CC genes, proteins, vectors containing the genes and Ab are also useful CC are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence CC factors and for identifying targets of human diseases for which P. CC luminescens is a model (particularly plague and whooping cough). This cC sequence represents one of the isolated P. luminescens genes

                                                                                                                        Escherichia coli bifunctional prephenate dehydrogenase. Sequences of t invention are useful for producing a plant such as cannla, maize, Arabidopsis, Brassica campestris, B.napus, soybean, crambe, mustard, castor bean, peanut, sesame, cottonseed, linseed, safflower, oil palm, flax and sunflower having increased tocopherol levels, especially alph or gamma-tocopherol or tocotrienol relative to a plant with a similar genetic background but lacking the exogenous nucleic acid molecule. The are useful for reducing tocopherol levels in a plant. They are also useful for producing plant expressing homogentesic acid and plants of the development of the development and plant of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of the development of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention comprise a promoter region functioning in a plant cell to cause production of an mRNA molecule linked to a heterologous nucleic acid molecule encoding an enzyme with prephenate dehydrogenase (tyrA) or chorismate mutase activities or a tyrA from Erwinia herbicola or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acid molecule encoding enzymes involved in tocopherol biosynthesis useful for enhancing or altering tocopherol production plants such as canola, maize, soybean, crambe, mustard, castor bean, peanut, sesame, or cottonseed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel nucleic acid molecules encoding enzymes involved in tocopherol biosynthesis. Polynucleotides of the
